

Ad Hoc Reporting

Ad Hoc reporting is a simple way for everyone to generate reports on the fly. It offers an easy-to-use interface which is wizard-like but powerful at the same time. Our solution enables you to create reports without needing to have specialized knowledge of the underlying database structure or advanced technical skills.

Ad Hoc Data View

An ad hoc data view is a simplified representation of a complex database. It offers a simple list of columns that can be used in an ad hoc report instead of a large number of joined tables.

An end user does not have to know the structure of a database and can dive into ad hoc reporting.

The ad hoc data views can be created with the i-net Designer.

Repository - Remote Designer (JNLP)

Since version 10 it is possible to start the i-net Designer in the repository browser. The i-net Designer can be used without installation on the client.
